March 2013.

APPLE has just officially announced that 100% of the energy that supply to their data centers becomes from renewable sources. Thus, the apple company has stopped completely dependent on generators that use fossil fuel, gas or coal. While 25% of their energy is provided by wind or geothermal power, 75% is covered by the ending construction of a new solar farm in North Carolina, last December. Renewable energy plants not only supply the voracious data centers of the company but also to several of their main offices and its headquarters in Cupertino.

The **London Array offshore** wind farm is the largest in the world and is now fully operational with 175 wind turbines from Siemens.

The London Array project is jointly owned by **D o n g E n e r g y**, Masdar and EON, and is located in the Thames

estuary. This installation is exporting wind energy enough to power 500,000 homes through a ground station in Graveney, near Faversham. The wind farm will have 630MW, which will result in an estimated reduction in CO2 emissions of over 900,000 tons per year. The second phase aims to increase total capacity to 870MW.

serena DIVISIONS.

GEARBOX. Business unit specializing in gearboxes. Serena has technical specialist with over 10 years experience in gearboxes of leading manufacturers.

QUALITY. From this unit Serena offers services related to Quality inspections at different stages of the wind farms construction and operation. These inspections are performed during the process of mounting and gathering in wind farm start-up end of warranty...
